

IN THE SPECIFICATION:

Please amend the second paragraph on page 14 as follows:

With reference now to **Figure 7**, a process flow and program function for separating textual information from a video and presenting it to a user is depicted in accordance with the present invention. To begin, a user's browser, such as, for example, client 108, receives data from a source, such as, for example, from server 104 via network 102 (step 702). The browser determines whether the data contains video or other moving image data (step 704). If the data does not contain video, then the data are presented to the user in a normal manner consistent with the prior art without using the text filter for filtering text from video content (step 706). If the data does contain video, then the browser determines whether the user has opted to have the text presented without the video (step 708). If the user has not opted to have the text presented [[without]]with filtering text from the video, then the video and text is presented to the user (step 706).
